State Population Estimates by Age and Sex: 1980 to 1992

INTRODUCTION

This report presents 1980 to 1992 population estimates for the United States, regions, divisions, and States. April 1980 and April 1990 figures are census counts; all other population figures are July estimates. Population totals, and age-sex detail are presented for the resident universe, while totals only are shown for the civilian universe. Components of resident population change for the April 1990 to July 1992 period are presented in the first table. The methodology section describes how our estimates are produced. The final sections of text provide information on revisions of the estimates, additional data, and alternative media.

A separate Current Population Report presenting an analysis of recent State and substate population trends, reflected in the tables of this report, is planned for the near future.

EXPLANATION OF TABLES

Table 1 presents total resident population from the 1990 decennial census, annual estimates for July 1990 to July 1992, and components of population change for the April 1990 to July 1992 period. This is the first report to show international net migration and Federal U.S. citizen migration as components (see the methodology section for details).

Residual change is also presented but is not a directly-measured component. It is developed by extracting the other four components from population change. Most of residual change is internal (domestic) net migration, though we have no accurate way to quantify it. Total domestic migration is currently not attainable because the elderly population is not calculated by a component procedure (see methodology section). In previous Current Population Report, Series P-25 this was labeled as "Residual Net Migration." Identifying Federal U.S. citizen migration separately now allows residual change to more closely approximate domestic migration.

One must use caution in interpreting the residual change component. This component is sensitive to everything that goes into creating the population estimates. It is influenced by domestic migration, but also by any inaccuracies in the other four components, or in any data entering the method. It is sensitive to the

method's treatment of special populations such as military or group quarters. It is affected by subduction to national controls. Anything that changes the final population estimate, or any other component, will also change the residual change component.

Table 2 presents an intercensal series¹ of annual resident population estimates from July 1980 to July 1989 that is consistent with both the 1980 and 1990 censuses.

Table 3 shows civilian population totals from April 1990 to July 1992.

Table 4 provides intercensal civilian population totals for the 1980's.

Table 5 contains July 1992 resident population estimates for commonly requested age groups.

Tables 6 and 7 present 1990 to 1992 resident population by 5-year age groups and sex, and median age. Table 6 displays the United States, regions, and divisions. Table 7 presents the States in alphabetical order.

Table 8 presents intercensal 1980's age-sex resident estimates for selected broad age groups along with median ages.

Table 9 shows the April 1990 to July 1992 percent change in resident State populations for selected broad age groups.

Table 10 presents the April 1990 and July 1992 percent distribution across age groups for States.

METHODOLOGY

The post-April 1990 estimates of total State population and the age-sex characteristics shown in this report are developed as separate but consistent entities. Our State population totals are derived by combining results of the Medicare Change Method which yields 65 and over (65+) population, with estimates of the under 65 (<65) population produced by the Federal Tax Returns Method. Our State population figures by single years of age and sex result from the Medicare Change Method and from individual ages yielded by a version of Component Method II. The age-sex figures are adjusted to be consistent with the State totals. The July 1990 estimates are not created by these methods, but are

¹ Intercensal estimates for the 1960's decade are presented in Current Population Reports Series P-25, No. 460, and for the 1970's in P-25, No. 998.

linear interpolations of the April 1990 census counts and the July 1991 estimates. The details of each method and its steps are discussed in the sections below.

Medicare Change Method. State estimates of the population over age 65 by single years of age and sex are based on the change in the number of persons covered under the Medicare program. Medicare enrollment by sex for 2-year and 5-year groups (up to age 85 and over) are collected for each July. The 1989 and 1990 data are interpolated to get enrollment figures for April 1, 1990. Availability of Medicare enrollment data lags one year behind the latest estimate date. Changes between the two last known enrollment figures are used to derive the latest missing enrollment data.

The 1990 census-based State population proportions by age are used to distribute the Medicare enrollment to single years of age 85 and over. The estimates for each single year of age and sex over age 65 result from adding to the 1990 census (modified)² population the change in Medicare enrollment between April 1, 1990 and the estimate date. As a final step, each age-sex cell is prorated to an independent national estimate.

Federal Tax Returns Method. This method formerly known as the Administrative Records Method, is a component procedure used for estimating the under 65 segment of the total State population. The estimate is developed in a series of steps:

1. The 1990 census is used to calculate the household population under 65 on the July 1991 estimate date. The under 65 age groups for the remaining years in the decade build off the previous year's Federal Tax Return Method estimate.
2. Births for the estimate period are added to the under 65 population.
3. Deaths to the under 65 population are subtracted.
4. Internal net migration is added.
5. An allowance for international net migration is also added to the population.
6. The previous five steps are worked through and controlled to an independent national under 65 household population estimate.
7. The group quarters population is added to obtain resident population under 65.

Calendar year births and total deaths by State of residence are collected annually from individual State vital statistics offices. Because of a lag in data availability, the most recent January to July data are estimated by using one-half of the previous calendar year data adjusted prorata to a reported national January-June figure.

²The 1990 census counts used in this report are the modified census counts described in CPH-L-74.

Calendar year deaths by age are obtained annually from the National Center for Health Statistics. Tabulations exist for ages under 1, 1 to 4, and 5-year age groups up to age 85 and over. These data usually lag two years, and missing data are estimated by duplicating the latest available year. National proportions are used to convert the State 5-year deaths to single year deaths. The State deaths by age are prorated to be consistent with the total deaths from the State vital statistics offices. Separation factors are used in apportioning deaths under 1 year of age. Deaths by single year of age are used to develop deaths to the under 65 population groups in the Federal Tax Returns Method, and as described later, in Component Method II.

The under 65 internal net migration component used in the Federal Tax Returns Method is derived from processing about 110 million Federal income tax returns provided by the Internal Revenue Service each year. The under 65 internal net migration component is developed by estimating an under 65 net migration rate for each State and applying it to an under 65 household population on the estimate date. Here's how it works.

The under 65 net migration rate is based only on tax returns where the primary filer's Social Security Number can be matched for two consecutive filing years. When the State of residence on the matched returns is the same in both years, the return (and all its exemptions) is said to be a nonmover across State lines. When the State of residence differs, the return (and all its exemptions) is said to be an interstate migrant. By definition an out-migrant from one State is an in-migrant to another.³ The exemptions found on 65 returns are used in calculating the migration rate because they have a more logical relationship with population than numbers of returns. The net migration rate for each one-year period is defined as:

In-Migrant Exemptions to the State	-	Out-Migrant Exemptions from the State
(Non-Migrant Exemptions + Out-Migrant Exemptions)		

The above net migration rate is applied to a population base consisting of the household population under 65 on the estimate date plus one-half of the sum of natural increase and international net migration within the period. The result is the internal net migration component.

There are nine categories of movement from abroad, four of which are considered "direct" because they cannot be derived by matching addresses on Federal tax returns.⁴ The four direct categories are combined to

³Returns to and from foreign areas are also included if they pass the matching process.

⁴For a detailed methodology and explanation of all types of international migration, telephone David Word on (301-763-1739) for a copy in the Technical Working Paper Series: report No. 1, *The Census Bureau Approach for Allocating International Migration to*

form the international net migration component used in development of the Federal Tax Return Method and shown in table 1. The four categories are: (1) Legal immigration as reported directly to the Immigration and Naturalization Service. (2) Undocumented immigration, our national estimate is 200,000 a year. (3) Emigration, our national estimates is 160,000 a year. (4) Puerto Rican migration is derived from annual passenger statistics data.

The movement of U.S. Armed Forces personnel and their dependents, and Civilian Federal Employees and their dependents, represent two nondirect categories of movement from abroad. These two categories are incorporated in the Federal Tax Returns Method through our tax matching system.

Because our tax matching system does not yield separate figures of Armed Forces and citizen movement, the two categories are combined and presented in table 1 as Federal U.S. citizen movement. The national figure shown in the Federal U.S. citizen component of Table 1 is consistent with the value to be shown in a forthcoming national estimates report. The state figures are approximations derived by (1) determining the difference between the 1990 census apportionment count and the 1990 census resident count for each State and the United States (2) applying each State's share of the United States difference to the 1990-92 national Federal U.S. citizen figure.

Component Method II-Age. A version of Component Method II is used to produce estimates for each single year of age by sex up to age 65. In this method each age follows the standard demographic formula of $P_1 = P_0 + B - D + M$: where P_1 is the population on the estimate date; P_0 is the population on the census date; B and D are the births and deaths occurring during the estimate period, and M is the net migration (including international net migration) occurring during the estimate period. This is a cumulative method, where the estimate period is from the date of the last census to the estimate date.

The steps used in estimating single years of age (0 to 64) for the civilian population are summarized below:

1. The resident cohort population by single year of age is developed by carrying forward the April 1, 1990 census count (for each age) to the July 1, estimate date;
2. Births entering each cohort for the period between April 1, 1990 and the July estimate date are added where appropriate;
3. An estimate of the Armed Forces cohort population for each age 17 to 64 on the estimate date, is subtracted from the resident cohort population to create the civilian cohort population;

4. An estimate of the net civilian migration for 1990 to the estimate date is added;
5. An estimate of the net change in civilian population entering the Armed Forces population during the estimate period is added.

The result of these five steps is unadjusted civilian age estimates, but without sex detail. Sex detail originates from the following steps:

1. The 1990 census proportion of male civilian population is calculated for each year of age by State.
2. National sex ratios by single year of age are calculated for both the 1990 census civilian population and for each estimate year.
3. The change in the national sex ratios between the estimate year and the census base year are used to update the 1990 State ratios.
4. These are applied to the State single year civilian population estimates for both sexes to obtain civilian sex detail by age.

Final steps in the component method for age are to: (1) adjust each age-sex cell (0 to 64) to an independent national civilian population estimate; (2) further adjust each age-sex cell within a State to the civilian state population total; (3) add estimates of Armed Forces by age and sex to the civilian population to produce resident population.

The vital statistics used in the age estimates are from the same sources used in the Federal Tax Returns Method. The net migration component revolves around elementary school enrollment and school-age migration. It is developed in two age segments. (1) State school-age net migration for the estimate period is used to formulate an amount of net migration for each age under age 17. (2) Each State's school-age migration rate is converted to net migration rates for single years 17 through 64, which are then applied to a base (cohort for that age minus one half the deaths to the cohort) in order to derive net migration amounts.⁵

The Armed Forces data used in this method and in the Federal Tax Returns Method are obtained by the Departments of Defense and Transportation. All military persons are assumed to be between the ages of 17 and 64. State Armed Forces data are not provided by age or sex. National level data are used to assign age-sex detail to the States. The group quarters data other than military barracks, are held constant from the last census.

⁵The methodology for developing the migration component by age is described in more detail in Current Population Reports, Series P-25, No 1010. The 1992 estimates use the 1982 migration adjustments described in No. 1010. Data from the 1990 census were not available to update the migration assumptions.

State Population Estimates for the 1980's. The July 1980-1989 intercensal State population totals and age-sex estimates shown in this report are consistent with both the 1980 and 1990 censuses. The latest set of 1980-based (postcensal) estimates totals and by age and sex⁶ were applied to the intercensal formula described in appendix A table. All intercensal State estimates are adjusted to be consistent with the independent national intercensal estimates of population.

ACCURACY OF THE ESTIMATES

As part of our population estimates evaluation program, we have prepared April 1, 1990 population estimates to compare with 1990 decennial census results. A summary of these comparisons are included as appendix B and C tables in this report. The full results of the April 1990 evaluation will initially appear in a Bureau of the Census working paper.

RELATED REPORTS AND REVISIONS

The population estimates for the 1980's presented in this report are consistent with the United States estimates published in Current Population Reports, Series P-25, No. 1095. They supersede the intercensal series for the 1980's released in October 1991 in Department of Commerce Note to Correspondents CB91-289.

⁶The 1981-89 postcensal estimates used in preparing these estimates supersede those found in Current Population Reports, Series P-25, No. 1058 and in earlier reports. The methodologies used to create them are described in Current Population Reports Series P-25, Nos. 957 and 1010.

The 1991 and 1992 resident population totals shown here were previously released in December 1992 in Department of Commerce Press Release CB92-276.

Revision to estimates input data are incorporated annually for all years in the current (1990's) decade. With region, division, and State population estimates, this update typically occurs near the end of each calendar year. As a result, the population estimates for prior years in the decade are revised when the current year's estimate is made.

ESTIMATES PRODUCTS AND DISPLAYS

For display purposes, the population figures in this report have been rounded to the nearest thousands without being adjusted to group totals, which are independently rounded. Unrounded versions of these data may be obtained by contacting the Census Bureau (source listed below). The age-sex estimates in this publication are presented in 5-year and broad age groups. Single-year population estimates by sex are also available (see below).

Current Population Reports are not the only form of release for population estimates products. Other media such as Press Releases, Note to Correspondents, and on-line computer services such as CENDATA or bulletin boards may have more recent data. Contact the Population Division Statistical Information Staff on 301-763-5002 for the most recent and consistent population estimates information and products.

The Population Division Statistical Information Staff should be the first point of contact for most questions and orders concerning population estimates. The staff will provide, or direct data users to, the desired estimates products. A fee may be charged for the requested material.

Table 1. Estimates of the Resident Population of States: July 1, 1992 and Components of Change Since 1990

[In thousands. Includes Armed Forces residing in each State]

^a-Represents zero or a number which rounds to zero.

¹The bulk of the residual change component is internal(domestic) net migration, though we have no reliable way to quantify it. The residual change figure is also affected by any inaccuracies in input data or variations in implementing the estimating method.

Table 2. Annual Intercensal Estimates of the Resident Population of States: 1980 to 1989

Appendix A. Method for Producing Intercensal Estimates of the Population of States: 1981-1989

This appendix describes the methodology used to derive the intercensal estimates of the resident population of States, divisions, and regions for July 1, 1981 to 1989.

The intercensals are consistent with the 1980 census counts as published in the U.S. Census Summary, PC80-1-B1 and the 1990 census modified counts. The latest set of 1981-90 postcensal (1980-based) State estimates were used in the intercensal formula described below. The sum of the intercensal state estimates for each year was adjusted to be consistent with independent national estimates of the intercensal population estimates.

Algebraically, the intercensal procedure can be described as:

$$P_t = Q_t (P_{10} / Q_{10})^{t/10}$$

The preceding formula is described in terms of the following notations: so that

- | | |
|-------|---|
| t | = time (years) elapsed since April 1, 1980,
$0 \leq t \leq 10$ |
| Q_T | = postcensal estimate at time t |
| P_T | = intercensal estimate at time t |

so that

- | | |
|----------|--|
| Q_0 | = P_0 = actual census count as of
April 1, 1980 |
| P_{10} | = actual census count as of April 1, 1990 |
| Q_{10} | = postcensal estimate for April 1, 1990 |

This procedure was also used in developing the annual intercensal population estimates for the United States.

Appendix B.

Hawaii.....	1,120,388	1,108,229	12,159	1.10

Note: The mean absolute percent error (MAPE) is 1.55. It is obtained by calculating the average percent deviation (regardless of sign) of the 1990 State estimates from the 1990 State census counts.

Appendix C.

Evaluation of 1990 State Age Estimates

Measures of Error(Percent) by 5 Year and Single Year of Age

5 year age groups	Mean absolute percent error	5 year age groups	Mean absolute percent error
0 to 4.....	2.53	44 to 49.....	2.43
5 to 9.....	2.82	50 to 54.....	3.61
10 to 14.....	2.49	55 to 59.....	4.71
15 to 19.....	2.98	60 to 64.....	5.92
20 to 24.....	5.24	65 to 69.....	2.86
25 to 29.....	7.93	70 to 74.....	2.20
30 to 34.....	6.10	75 to 79.....	1.21
35 to 39.....	3.53	80 to 84.....	2.69
40 to 44.....	1.88	85 and over.....	3.00

Single year of age	Mean absolute percent error	Single year of age	Mean absolute percent error
0.....	2.76	45.....	3.22
1.....	2.80	46.....	3.03
2.....	2.93	47.....	3.48
3.....	2.83	48.....	3.27
4.....	2.64	49.....	3.95
5.....	2.97	50.....	3.17
6.....	3.03	51.....	3.59
7.....	3.43	52.....	3.73
